Licensed for behind a firewall, externally hosted, or ASP

Incremental functionality – purchase the functionality *your organization* requires

Trusted supplier in IntraLearn Software

Should You Include eLearning in Your Software?

Does your application require users to be trained before they can effectively use the software? Do you currently hold classroom-style training events? Do you certify users on the use of your software? If well-trained customers are essential to the full adoption and success of your application, eLearning may be an affordable solution.

Why Use an eLearning System?

eLearning is used world-wide by organizations looking to conveniently deliver requisite training to their employees. By embedding eLearning technology into your application, your customers will have a customized solution to receive training applicable to your product. User activity and progress is tracked by reports which can be used for certification and compliance purposes. Customers using the eLearning system are less likely to call support staff for assistance. The net result is a distinct competitive advantage in your market.

What is LearningServer?

LearningServer is a highly scalable and customizable eLearning software application. Launching, tracking, and managing course content is effortlessly handled by LearningServer. Your customers can easily begin taking courses on product training, troubleshooting guidance, and more. Exportable reports detail user progress, grades, courses enrolled, time spent taking courses, and more to assist in tracking compliance.

Is it Easy to Install / Implement?

LearningServer can be installed and fully functional within a few hours. With its small footprint, the product can be embedded into your application, hosted externally, or provided by you as an ASP offering. Implementation is effortless by using a variety of web services and APIs or a link in your software. Industry-standard SCORM and AICC compliant course content, created by 3rd party products or course developers, can be immediately uploaded and launched. Content from Microsoft Office or other 3rd party products can be created and converted into effective and measurable training with optional add-on modules from IntraLearn Software. A variety of other add-on modules are also available to further enhance the capabilities of your offering.

The Company

IntraLearn Software Corporation (ISC) of Northboro, MA is a leading provider of Microsoft technology-based configurable eLearning software applications for corporate enterprises, academic institutions and not-for-profit organizations. ISC's software is distributed worldwide through authorized resellers and hosting / Application Service Providers to more than 2,000 major organizations in 45 countries and 17 languages.
